

Marine Area Rules

1 ••••• Season and Daily Hours:

Fishing for fin fish is CLOSED in marine waters unless a season is specifically authorized for a species under the Marine Area Rules. During an open season, marine waters are open 24 hours per day, except as noted for night closures.

2 ••••• Quota Management:

SALMON, HALIBUT and some SHELLFISH are managed by quotas in many marine areas. These fisheries close when the quotas have been taken. Closures will be announced to local news media and included in the Fishing Hotline and Shellfish Rule Change Hotline messages.

NOTE: Emergency rules may occur throughout the year and will supersede the rules contained in this pamphlet. Changes can be found by contacting the WDFW Fishing Hotline, the Shellfish Rule Change Hotline, statewide customer service, and are also available on the WDFW website. (See contact information on page 9.)

Rules listed below are General Rules. Specific Area Rules are listed by area.

Salmon Identification

OCEAN PHASE

Chinook Salmon

Large black spots on back, dorsal fin, and both the upper and lower lobes of the tail. Dark mouth with a black gum line. Average size scales. Silver pigment on the tail. Prominent teeth.

Coho Salmon

Black spots on back with a few spots on the upper portion of the tail. White mouth with a white gum line and dark tongue. Average size scales. Silver pigment on the tail.

Chum Salmon

No prominent spots on back or tail (small speckles may be present). White mouth with a white gum line and dark tongue. Large scales. Caudal peduncle (tail base) is slender. Silver pigment on the tail.

Pink Salmon

Generally large black spots on back and heavy oval shaped black blotches on the upper and lower lobes of the tail. White mouth with a black gum line and tongue. Very small scales. No silver pigment on the tail. Flexible (rubbery) lower jaw.

Sockeye Salmon

No prominent spots on back or tail (small speckles may be present). White mouth with a white gum line and dark tongue. Average size scales. Prominent gold-colored eyes. No silver pigment on the tail. Small teeth.

SPAWNING PHASE

Chinook Salmon

Chinook Salmon do not display the conspicuous morphological changes of pink, chum and sockeye salmon during the spawning stage. Typically, Pacific salmon turn from the silvery bright ocean coloration to a darker color as they approach spawning. Chinook are often the largest of the Pacific salmon, and the large size is characteristic in mature fish.

Coho Salmon

In mature male coho salmon, the upper jaw forms an elongated hooked snout and the teeth become greatly enlarged. The spawning color of the male is generally brighter than that of the female and is characterized by the dorsal surface and head turning bluish-green. The sides of the males develop a broad red streak. In females, the jaws also elongate but the development is much less extreme than of the males.

Chum Salmon

Chum salmon display characteristic olive-green and purple (calico) vertical bars on the sides of the body as they approach the spawning phase. Both males and females develop hooked noses and large canine-like teeth, although the males characteristics are more pronounced.

Pink Salmon

As male pink salmon begin to enter the spawning phase, they develop a prominent hump in front of the dorsal fin like that of the male sockeye salmon. Males develop a characteristic elongated snout and large teeth. Body color in both males and females darkens from a bright silvery appearance to a pale slate, brownish, or greenish-gray on the back and sides and a pale whitish color below. Small, oblong irregular black spots are present on the back and sides, and on the dorsal and tail fins.

Sockeye Salmon

Sockeye salmon turn bright red on their body, and olive-green on the head as they begin to enter the spawning phase of their life. Males of this species develop a prominent hump in front of the dorsal fin. Also, the male's snout becomes elongated and canine-like teeth grow out of the receding gums. Females undergo distinct color change but retain their body shape.

Atlantic Salmon

Male Atlantic salmon

Female Atlantic salmon

Atlantic salmon have large black spots on the gill covers and back, with rarely any spots on the tail fin. Their scales are large, there is no red stripe along the lateral line and they have 8-10 anal fin rays. Atlantic salmon may be taken from marine waters during any open salmon season, and from anadromous (not landlocked) freshwater during any open salmon or trout season. Anglers may not, however, continue to fish for Atlantic salmon after a daily limit of another species of salmon has been retained. In landlocked lakes, Atlantic salmon may be taken as part of the trout daily limit. Seasons and size limits in place for trout apply to Atlantic salmon in landlocked lakes. Opportunities to harvest Atlantic salmon beyond those listed in the pamphlet will be announced to the news media and carried on WDFW's recreational fishing hotline.

Coho and Chinook Salmon Identification

Coho salmon have black spots on their back with a few spots on the upper portion of the tail, and a white gum line and dark tongue.

Chinook have large black spots on their back, dorsal fin, and both the upper and lower lobes of the tail, and a dark mouth with a black gum line.

Wild/Hatchery Identification

In order to provide salmon & steelhead fishing opportunities, WDFW and the Tribes have marked salmon & steelhead by clipping the adipose fin (a small fatty fin directly behind the dorsal fin). In areas designated "release wild <insert fish name>", fin clipped salmon and steelhead are the only fish that may be retained. The picture to the right shows a wild coho salmon and a fin clipped or hatchery coho salmon. Please be careful in releasing wild fish– they are your fishing future! For tips on the best way to release fish, please see page 14. In Marine Areas 5-13, it is illegal to bring a wild salmon or a species of salmon aboard a vessel if it is unlawful to retain those salmon. "Aboard a vessel" is defined as inside the gunwale.

Hatchery coho
Adipose fin has been clipped – leaving a healed scar in its place.

Wild coho
Intact adipose fin.

WDFW Tagging

The Department of Fish and Wildlife has released millions of CHINOOK and COHO salmon with microscopic coded-wire tags implanted in their heads. At one time, these fish also had their adipose fins removed. However adipose fin removal is now used to indicate hatchery-origin CHINOOK and COHO. The missing adipose fin no longer is a marker for coded-wire tagged SALMON. WDFW samplers carry equipment to detect tags and will be collecting only the heads that actually carry a tag.
